# How to Calculate Pressure (Kg) Needed for a Gas Strut 

Formula
Height (mm) x Weight of the door (kg) x $0.6=P$ Dimension x Kg Needed $H x W x 0.6=P \times K g$

$$
\begin{array}{ll}
H=1200 \mathrm{~mm} & P=200 \\
W=30 \mathrm{~kg} & \mathrm{Kg}=?
\end{array}
$$

## Real Life Calculation

| $1200 \times 30 \times 0.6$ | $=200 \times \mathrm{Kg}$ |
| ---: | :--- |
| 21600 | $=200 \times \mathrm{Kg}$ |
| $21600 \div 200$ | $=\mathrm{Kg}$ |
| 108 | $=\mathrm{Kg}$ |

$108 \div 2$ Gas Struts $=54 \mathrm{Kg}$ per Gas Strut
